

What the observer sees: native shape vs defended shape

native response

observed shape: [49] · timing: variable (median 1.3 ms read, 2.1 ms select)

defended response

observed shape: [28,21] · timing: fixed policy value (≈ 4.0 ms)

the reassembled response is still 49 bytes (28 + 21) — only the observed shape and timing change

The defense fixes the segment shape and the CLRT to a single policy value, so the read and select classes become indistinguishable by these two features; it does not hide the total 49-byte length, which a full TCP reader still recovers.
